-1- TISOUS PEECIFICITY: Widely expressed. Isoforms 1 and 2 are expressed in peripheral blood leukocytes, chronic myelogenous leukemia cell line K-562, followed by thymus, spleen and heart. Also detected in lung, placenta, small intestine, colon, kidney, liver and miscle
                                                                                                                                                                                                                                                                                                                                                                                                               SUBUNIT: Interacts strongly with caspase 2, weakly with caspase 9 and with APAF1 in a cytochrome c-inducible way leading to the formation of an apoptosome. This interaction may be ATP-dependent. SUBCELLULAR LOCATION: Cytoplasmic.

                                                                                                                                                     Kochrer K., Beyer A., Mewes H.-W., Gassenhuber J., Wiemann S., Submitted (SEP-1999) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Able to form cytoplasmic structures termed death effector filaments. Enhances APAF1 and cytochrome c-dependent activation of pro-caspase-9 and consecutive apoptosis. Seems to bind ATP.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      liver and muscle.

Note=No experimental confirmation available;
ISOE SPECIFICITY: Widely expressed at low levels. Detected in peripheral blood leukocytes, lung, small intestine, spleen, thymus, colon and at lower levels in placente, liver and kidney. Very low expression in skeletal muscle, heart and brain. Detected in the leukemia cell lines Hi-60 and U937, but not in Jurkat T-cell lymphoma and Daudh Burkitt's lymphoma. Detected in the melanoma and Daudh Burkitt's lymphoma. Detected in Hele cervical carcinoma cells and Molt 4 lymphocytic leukemia cells. Islencing may affect genes and proteins that act as positive mediators of cell death.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            FUNCTION, AND SUBCELLUTAR LOCATION.

"Evaluation and characterization of a porcine small intestine cDNA

library: analysis of 839 clones.";

Mamm. Genome 7:509-517(1996).

INFECTION: MAY PLAY A ROLE IN MEDIATING RESISTANCE TO VIRUS

-: FUNCTION: MAY PLAY A ROLE IN MEDIATING RESISTANCE TO VIRUS

-: CATALYTIC ACTIVITY: Binds double-stranded RNA and polymerizes ATP

INFECTION: CONTROL OF CELL GROWTH, DIFFERENTIATION, AND APOPTOSIS.

-: CATALYTIC ACTIVITY: Binds double-stranded RNAs into that, when activated, cleaves single-stranded RNAs.

-: SUBGNIT: Homotetramer (S) similarity).

-: SUBGNIT: Homotetramer (S) similarity).

-: SUBCELLULAR LOCATION: ASSOCIATED WITH DIFFERENT SUBCELLULAR FRACTIONS SUCH AS MINICARIA, NUCLEAR, AND ROUGH/SMOOTH MICROSOMAL FRACTIONS (BY SIMILARITY).

Binds to caspase-9 and RICK by CARD-CARD interaction.
-!- SUBURLINITEAR LOCATION: Cytoplasmic.
-!- TISSUB SPECIFICITY: Highly expressed in adult heart, skeletal muscle, pancreas, spleen and ovary. Also detected in placenta, lung, liver, kidney, thymus, testis, small intestine and colon.
-!- SIMILARITY: Contains 1 CARD domain.
-!- SIMILARITY: Contains 9 leucine-rich (LRR) repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      MEDLINE=21264704; PubMed=11058605;

"Complementary DNA cloning and sequencing of the chicken muscle ecto-ATPase. Homology with the lymphoid cell activation antigen CD39."; J. Biol. Chem. 272:1076-1081(1997).
                                                                                                                                                                                                                                                                                                                                                               912.221 smooth mustire.;

1. Biochem. Biophys. Methods 29:61-75(1994).

1. FUNCTION: In the nervous system, could hydrolyze ATP and other nucleotides to regulate purinergic neurotransmission. Hydrolyzes ADP only to a marginal extent (By similarity).

1. CATALYTIC ACTIVITY: ATP + H(2)0 = ADP + phosphate.

1. COFACTOR: Requires calcium and magnesium.

1. SUBCELLULAR LOCATION: Integral membrane protein (Potential).

1. PTM: Has probably disulfide bonds.

1. SIMILARITY: Belongs to the GDA1 / CD39 NTPase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

-1. FUNCTION: MAY PLAY A ROLE IN MEDIATING RESISTANCE TO VIRUS

-1. FUNCTION: CONTROL OF CELL GROWTH, DIFFERENTIATION, AND APOPTOSIS.

-1. CATALYTIC ACTIVITY: Binds double-stranded RNA and polymerizes ATP into PPP(A2'P5'A)N oligomers, which activate the latent RNase L that, when activated, cleaves single-stranded RNAs.

-1. SUBUNIT: Homotetramer.

-1. SUBUNIT: Homotetramer.

-1. SUBCELLULAR LOCATION: ASSOCIATED WITH DIFFERENT SUBCELLULAR FRACTIONS BUTCH DIFFERENT SUBCELLULAR PRACTIONS.

IsoId=P00373-3; Sequence=VSP_003740;
-!- INDUCTION: By interferons.
-!- SIMILARITY: Belongs to the 2-5A synthetase family.
-!- CAUTION: Ref. 8 sequence differs from that shown due to a frameshift in position 400.
-!- CAUTION: Ref. 4 sequence was originally thought to originate from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 MEDLINE-88283644; PubMed=2456211;

C. Beroirus-related reverse transcriptase pseudogene - slow loris

C. Species: Nycticebus coucang (slow loris)

C. Jate: 31-Mar-1988 #sequence_revision 04-Jan-1996 #text_change 14-May-1999

C. Accession: B25313

R. Hattori, M.; Kuhara, S.; Takenaka, O.; Sakaki, Y.

Nature 321, 625-628, 1986

A. Attale: L. family of repetitive DNA sequences in primates may be derived from a sequence A. Reference number: A93381; MUID:86230917; PMID:2423883

A. Accession: B25313

A. Status: conceptual translation of pseudogene

A. Molecule type: DNA

A. Residues: 1-1260 -HAT>

A. Note: this sequence was constructed from an alignment of six sequences, determined by C. Keywords: reverse transcriptase; pseudogene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              hypothetical protein Cj1679 [imported] - Campylobacter jejuni (strain NCTC 11168)

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Sequence 66, Application US/09340620A

Patent No. 6482933

GENERAL INFORMATION:

APPLICANT: Bertin, John

TITLE OF INVENTION: NOVEL MOLECULES OF THE CARD-RELATED PROTEIN FAMILY AND USES THERE
FILE REFERENCE: 07334-124001

CURRENT FILING DATE: 1999-06-28

PRIOR PELLOR TON NUMBER: US 09/245,281

PRIOR PELLOR DATE: 1998-02-05

PRIOR PELLOR DATE: 1998-02-05

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               8
                                                                  The present sequence is a human NB-ARC and CARD containing protein (NAC) gamma isoform. Nac gamma isoform represents the NAC splice variant in which both the splice regions are absent in the translated polypeptide. NAC protein comprises a nucleotide binding (NB) domain (also referred as NB-ARC domain). A caspasse-associated recruitment domain (CARD) and a TIM-BARC domain. The caspasse; cysteine aspartyl protease, are principal effectors of apoptosis. CARD containing NAC proteins are used for screening modulates spoptosis, cytokine production, cytokine receptor signalling and other cellular processes. NAC can an immunogen for the production of polyclonal and monoclonal antibodies. It can also be used to diagnose and treat inflammatory disorders such as sepsis, fibrosis and arthritis and cancer pathologies such as adenocarcinomas and leukaemias
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1303 LHFVDQYREQLIARVISVEVVLDXLHGQVLSQEQYERVLAENTRPSQMRKLFSLSQSWDR 1362

The invention relates to identifying compounds, that modulate interaction between caspase recruitment domain (CARD)-7 and CARD-5. The method involves measuring the binding of CARD-7 and CARD-5 in the presence of the compound (an increase in the binding of CARD-7 to CARD-5 in the presence of the compound compared to the binding in the absence of the compound indicates that the compound is a modulator of CARD-7-CARD-5 in the presence of the compound indicates that the compound is a modulator of CARD-7-CARD-5 in the presence of the compound indicates that the compound is a modulator of CARD-7 and CARD-8 expression or activity can be used to treat or diagnose disorders such as cancers, bacterial or viral infections, untoinmuned disorders (systemic lupus erythematosus, immune-mediated glomerulonephritis or arthritis) inflammatory disorders, organ-specific autoimmunity including multiple sclerosis, Hashimoto's thyroiditis, or Grave's disease, psoriasis, graft rejection, allergies. CARD-7 and CARD-8 are useful as modulating agents in regulating a variety of cellular processes including cell growth and cell death. The present sequence represents the human CARD-7, an intracellular protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ·

The invention relates to isolated nucleic acid molecules (I) encoding human leucine-rich repeat small intestine I (HLRRSII) polypeptides. The nucleic acid molecules and polypeptides are useful for preventing, conditions, such as proliferative, creating and ameliorating medical conditions, such as proliferative, creating and ameliorating medical conditions, such as proliferative, condition, either directly or indirectly. They are also useful for treating, preventing and/or diagnosing diseases, disorders and/or conditions of: immune system conditions or inhibiting the proliferation, differentiation, or mobilisation of immune cells, haematopoietic cells e.g. thrombocytopenia, anaemia; immunologic deficiency syndromes, e.g. human immune deficiency virus (HVV) infection, HTLV-BLV infection; blood coagulation disorders, e.g. atterial thrombosis; autoimmune disorders, e.g. Addison's disease, c.g. chronic prostatitis, sepsis; proliferative disorders, e.g. cancer; cardiovascular disorders, e.g. arrhythmia, mycocadial ischaemias, aneurological disorders, e.g. measles, mumps, pneumonia, or viral, cardiovascular differences, e.g. measles, mumps, pneumonia, or viral, concea; infectious diseases, e.g. measles, mumps, pneumonia, or viral, concea; infectious diseases, e.g. measles, mumps, pneumonia, or viral, concea; and fungal infections. The HRRSII polypeptides are useful for modulating cytokine production, antigen presentation, or other processes such as boosting immune responses. HBG78454-ABG78474 represent HIRRSII camino acid sequences and related amino acid sequences of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 LHFVDQYREQLIARVTSVEVVLDKIHGQVLSQEQYERVLAENTRPSQMRKLFSLSQSWDR 1394

the invention relates to isolated nucleic acid molecules (I) encoding the invention relates to isolated nucleic acid molecules and polypeptides are useful for preventing.

Comucleic acid molecules and polypeptides are useful for preventing, contacting medical conditions, such as proliferative, gastrointestinal, renal, neural, or reproductive disorders; or disorders related to aberrant calcium regulation or apoptorsis modulation, either directly or indirectly. They are also useful for treating, preventing and/or diagnosing diseases, disorders and/or conditions of: immune system conditions of immune cells; haematopoietic cells e.g. thrombocytopenia, anaemia; immunologic deficiency syndromes, e.g. human immune deficiency virus (HIV) infection, HTLV-BLV infection; blood coaqulation disorders, c.g. arterial thrombosis; autoximune disorders, e.g. Addison's disease, c.g. chronic prostatiis, sepsis; proliferative disorders, e.g. cancer; cardiovascular disorders, e.g. arrhythmia, myocardial ischaemias, corrected risorders, e.g. arrhythmia, myocardial ischaemias, corrected risorders, e.g. arrhythmia, myocardial ischaemias, chorea; infectious diseases, e.g. Alzheimer's disease, Huntington's chorea; infectious diseases, e.g. Alzheimer's disease, Huntington's concertial, and fungal infections. The HIRSII polypeptides are useful for modulating cytokine production, anigen presentation, or other processes cuch as boosting immune responses. ABG78454-ABG78474 represent HIRRSII omino acid sequences and related amino acid sequences of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated nucleic acid molecules encoding HLRASII polypeptides, or their fragments and homologues, useful for preventing, treating and ameliorating medical conditions, e.g. proliferative, gastrointestinal, or

```
The present sequence represents a human leucine-rich repeat domain containing protein, which was used as a probe to search for leucine-rich repeat containing protein HIRRBMI Polypeptides and pelpatides and polymerleotides are useful for preventing, treating or ameliorating a disorder related to aberiant apoptosis modulation, either directly or indirectly, and in modulating signal transduction activity in various colls, tissue and organisms. They are also useful for treating, preventing, or diagnosing diseases, allergic conditions (e.g. asthma), cardiovascular disorders, and neurological diseases, and for increasing the organisms ability to synthesize add/or release pheromones. The polypeptide may also be used in treating, preventing or ameliorating pulmonary disease (e.g. chronic obstructive pulmonary disease, allergic rhinitis, on bronchial hyperresponsiveness), reproductive disease, haematopoletic disease, platelet disorders (e.g. innate immunity to bacterial synthogens, or adaptive immune responss, immune and inflammatory diseases and cancers. HirRBMI nucleic acids may further be used in chromosome and cancers. HirRBMI nucleic acids may further be used in chromosome and cancers. HirRBMI nucleic acids may further be used in chromosome and marker, as diagnostic probes, in gene therapy, in raising anti-DNA antibodies, or as antigens for eliciting immune responses

containing proteins expressed in nervous system tissues, HIRRNSI. The HIRRNSI polypeptide or the polymuclectide is useful for preventing, treating proteins expressed in neural disorder or a disorder related to aberrant apoptosis modulation (either directly or indirectly, renal disorder, immune disorder (e.g. arthritis, asthma, acquired inmune disorder (e.g. arthritis, asthma, acquired immune disorder (e.g. arthritis, userna, acquired immunedisorder), reproductive, pulmonary or cardiovascular diseases, hyperproliferative disorders, neurodegenerative diseases (e.g. Alzheimer's disease, parkinson's disease or Huntington's diseases (e.g. Alzheimer's disease, and autoimmune diseases, nervous system diseases and/or disorders, and autoimmune diseases (e.g. Addison's disease, haemolytic anaemia, antiphospholipid syndrome, or allergic encephalomyelitis). The polymucleotides are also useful as chromosome markers, for chromosome identification, gene therapy, and in identifying or aleucine-rich repeat containing protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1335 LHFVDQYREQLIARVTSVEVVLDKLHGQVLSQEQYERVLAENTRPSQMRKLFSLSQSWDR 1394

The present invention relates the DNA and their encoded proteins, where the proteins contain at least one PYD (pyrin) domain. These can be used to treat diseases causedated with impaired intracellular signal transduction, particularly inflammation such as psoriasis, arteriosclerosis, bacterial or viral infections (particularly meningitis and pneumonia), multiple sclerosis, rheumatoid arthritis, asthma, sarcoidosis, glomerulonephritis and osteoarthritis, and also Alzheimer's and parkinson's diseases. The present sequence is a protein of the New DNA encoding protein with pyrin domain, useful for treating diseases involving impaired signal transduction, particularly inflammation, also proteins and antibodies. Pyrin domain; PVD domain; antiinflammatory; antiparkinsonian; antiarteriosclerotic; antipsoriatic; antibacterial; virucide; neuroprotective; antiarthritic; antirheumatic; antiasthmatic; nephrotropic; osteopathnic; nootropic; intracellular signal transduction; inflammation; Alzheimer's disease; infection; psoriasis; asthma; arteriosclerosis; multiple sclerosis; rheumatoid arthritis; sarcoidosis; osteoarthritis; glomerulonephritis. 1429 1395 KCKDGLYQALKETHPHLIMELWEKGSKKGLLPLSS Pyrin domain containing protein NALP1-hs. Assays for identifying compound that modulates the interaction of caspase recruitment domain-8 with a CARD-8 ligand or a compound that modulates activity of CARD-8. recruitment activity of

Disclosure, Fig 1; 49pp; English.

The present invention relates to methods of identifying compounds that regulate caspase activity using caspase recruitment domain=9 (CARD-8) or caspase recruitment domain=9 (CARD-8). In particular, a method for identifying a compound that modulates the interaction between CARD-8 and caspase-1, pseudo-interleukin-1 (IL-1) beta converting enzyme (pseudoICE) cor ICEBERG is disclosed. CARD-7 and CARD-8 molecules are useful as modulating agents in regulating a variety of cellular processes including cell growth, cell death, and inflammation. The methods of the invention cor increase/decrease apoptosis, or compounds that have the ability to induce caspase increase/decrease apoptosis, or comprise the ability to induce caspase correctly or increase/decrease apoptosis, or comprise the ability to induce caspase activation. The methods are useful for treating disorders associated with an undesirably low rate correctly or treating disorders associated with an undesirably low rate correctly interaction, acloon cancer, lung carcinoma, etc), viral infections, autoimmune diseases caused by low levels of apoptosis (c.g. systemic lupus erythematosus, immune-mediated glomerulonephritis, and arthritis). The methods are also useful for treating disorders with cundesirably high rates of apoptosis such as human immunodeficiency virus (HIV) infection, Alzheimer's disease, spinal muscular atrophy, various forms of cerebellar degeneration, anemia associated with chronic disease, aplastic annemia, chronic neutropaenia, myelodysplastic confusoriates (LIS), retinitis pigmentosas, spinal muscular atrophy, confusores (e.g. crohn's disease, reactive, and various inflammatory confusores (e.g. crohn's disease, reactive, arthritis, insulin dependent diabetes mellitus, multiple sclerosis, psoriasis, graft rejection, allergic rhinitis, food allergies, conjunctiis, graft rejection,
